Description

As a standard gateway for the Industrial Internet of Things (IIoT), the piSmart-Gateway-I module collects data in the direct environment of machines and plants, evaluates them and processes measured values on the gateway itself or in the cloud.

- › RFID for reliable reading of RFID tags over short distances
- › CAN bus for data exchange between several participants over medium distances
- › GNSS for accurate location of the unit
- › Multi-function sensor for various measured values such as temperatures, self-motion and orientation of the unit
- › Multiple digital IOs for expansion with a motor or forked light barriers

Operation Location

The piSmart-Gateway-I is a flexible gateway for IoT applications through a wide variety of interfaces and features a small form factor.

- › Activation of locks for e.g. sharing services or cycle stations
- › Sensor data acquisition and data readout
- › Control of a DC motor in a range specified by forked light barriers
- › Vehicle theft protection
- › Retrofit module for existing systems

The gateway is specifically designed for space-constrained environments and can withstand shock, vibration and extreme temperature conditions.

Application-specific modifications are possible - for example, the form factor, interfaces and performance can be customised.
